### Current Industrial Reports

U.S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS

### INSTRUCTION MANUAL

FOR REPORTING ON FORM M-3 FOR 1978

MANUFACTURERS' SHIPMENTS, INVENTORIES, AND ORDERS

MONTHLY REPORT

#### M-3 (1-10-78)

#### PURPOSE OF SURVEY

The manufacturers' shipments, inventories, and orders survey is currently the only survey which provides broad-based monthly statistical data on the economic conditions in the domestic manufacturing sector. It is designed to measure current industrial activity and to provide an indication of future production commitments. The published value of shipments measures the value of goods delivered during the month by domestic manufacturing operations. New orders figures serve as an indicator of future production commitments and represent the current sales value of new orders received during the month, net of cancellations. Substantial accumulation or depletion of backlog of unfilled orders are used as measures of excesses (or deficiencies) in demand for manufactured products. The level of inventories, especially in relation to shipments, are frequently used in monitoring business cycle developments.

The survey panel includes nearly all manufacturing companies with 1,000 or more manufacturing employees and a sample of smaller firms. Data are compiled and published for shipments, new orders, unfilled orders, and inventories for the entire manufacturing sector with approximately 40 industry categories. The monthly estimates are prepared by using the month-to-month percent change of the reporting panel to bring forward the industry estimates. It is, therefore, important that the data reported in consecutive months be comparable.

Sample copies of publications are available free of charge to survey respondents.

Contents of this manual — Along with your general instructions, this reissue of the instruction manual includes your file copy and definitions of the industry groups used in this survey. Please read the instruction manual carefully before completing your form. If you have any questions or need additional information, do not hesitate to call Mr. William C. Menth on (301) 763-2502.

- Part A Gives general instructions
- Part B Explains the general format of your report form
- Part C Provides specific definitions of the data to be reported
- Part D Appendix Contains definitions of the industry groups used in this survey as related to the Standard Industrial Classifications (SIC)
- Part E Contains your file copy of all the items covered in this survey

#### Part A - GENERAL INSTRUCTIONS

#### ▶ 1. Filing Your Report

Since the first results of this survey are published about 20 days after the end of the survey period, we are grateful to those companies who file reports by the 15th of the month. In order to make these initial results more reliable and to meet the increasing need for timely economic information, we suggest that you consider some of the following reporting arrangements if your company does not file a report by the 15th day of the month.

- o. Split mailing Some companies have informed us that shipments and orders data are available much earlier than inventory data. For these companies, separate forms are mailed. If your company would be interested in changing the format of the monthly form, please notify us.
- **b.** Preporing the form While typed responses generally facilitate more rapid processing of the survey form, handwritten responses are acceptable.

c. Use of estimotes — It has been our experience that many companies can make accurate estimates of their figures several days in advance of the availability of the actual data. Under such conditions, early estimates are generally submitted by telephone or on a photo copy of the survey form with the revised (actual) data being submitted as soon as it is available. If your company is not generally able to provide actual figures by the 17th day of the month, we would appreciate your providing estimates.

If you misplace the return envelope the mailing address for submitting your form is:

Bureau of the Census ATTN: Industry Division Room 2232, FB 4 Washington, D.C. 20233

#### Part A - GENERAL INSTRUCTIONS - Continued

#### ▶ 2. Confidentiality of Data

This report is authorized by law (title 13, United States Code). Although you are not required to respond, your cooperation in this voluntary survey is needed to make the results of this survey comprehensive, accurate, and timely. By section 9 of the same law, your report to the Census Bureau is confidential. It may be seen only by sworn Census employees and may be used only for statistical purposes. The law also provides that copies retained in your files are immune from legal process.

#### ▶ 3. Publication of the Survey Results

The first release of the survey results is generally about 20 days after the end of the month covered in the survey (e.g., January figures are released on or about February 20th). A second release, based on more complete survey response, follows about 10 days later. Reponding companies are entitled to receive complimentary copies of the monthly publications. If you or your marketing department would be interested in knowing more about the manufacturing statistics prepared, please call or write us.

#### ▶ 4. Information Collected in this Survey

A complete listing of the information requested in this survey is given in Part E of this manual. Your form will only have preprinted items for the information you have reported in the past. Please review this list and include any additional responses that may be applicable to your company. Specifically:

#### o. Inventory Valuation Methods

(1) If your company reports any portion of its inventories on the last-in-first-out (LIFO) method, you should be completing item codes 9010, 9020, and 9030\* where applicable. The change in the book value of inventories is used by the Bureau of Economic Analysis of the Commerce Department in the computation of GNP. This procedure requires reducing inventory book values to constant dollars. LIFO inventories require different deflating procedures from inventories valued on other methods.

(2) If your company reports any portion of its inventories on the standard cost method, you should be completing item codes 9040, 9050, and, when applicable, 9060\*. When standards are revised, the monthly inventory movements are a combination of physical and valuation changes. To be most useful, these data must be deflated when standards are revised so that inventory movements reflect physical changes.

(3) If your company reports inventories on both the LIFO and standard cost methods, you should be completing item codes 9020, 9050, 9070, 9030, and, when applicable, 9060\*.

If your inventories are reported on LIFO, standard cost, or both, and the proper item codes do not appear on your report form, please indicate this fact in the "REMARKS" section of your report form or call Mr. William C. Menth on (301) 763–2502.

#### b. Unfilled Orders

If you have unfilled orders as of the end of the month and are not reporting in item code 3000, please attempt to supply this information.

<sup>\*</sup>Refer to page 6 for item code descriptions

#### Part B - HOW TO REPORT

#### ▶ 1. Person to Contact

Enter the name and telephone number of the person to contact at your company regarding this report, if it is not preprinted on the form. If the preprinted name or telephone number is incorrect, cross it out and enter the correct information. Because of the lag involved in processing these forms, it usually takes two reporting periods for the correction to appear on your report form.

#### ▶ 2. Revisions to Previous Data

Please review all of the figures in your previous reporting periods (columns (e) and (f) of your report form). If any of these figures have been revised, please make the necessary corrections. If revisions should be made to figures for periods which do not appear on the report form, please indicate the necessary revisions in the "REMARKS" section of your report form. It is important that the Census Bureau be aware of the revisions which have been made to previously reported data.

#### ▶ 3. Special Uses of the "REMARKS" Section

If there are significant changes (large increases or decreases) in the reported figures from month-tomonth, please use the "REMARKS" section of your report form to explain these differences.

If these differences are the result of (1) unusual fiscal months; (2) strikes or plant shutdown; (3) unusual seasonal patterns; (4) changes in the scope of the activities covered by this report; and/or (5) changes in the basis for reporting, please note this in the "REMARKS" section of your report form.

#### ▶ 4. Reporting Period

Although this survey is designed to cover a calendar month's activity, you may be reporting your figures for a different period of time. In part I of the report form, mark the box which best describes the period for which you are reporting (one calendar month, 4-weeks, or 5-weeks). If your records are for thirteen 4-week periods, please enter in the "REMARKS" section of the report form the exact dates covered by your report.

#### ▶ 5. Standard Industrial Classification of Industry Groups

Each company report has been classified into one of 79 separate industry categories which are groupings of the Standard Industrial Classification (SIC) codes. These groups and their respective codes are identified in the Appendix of this manual. A description of the industry group and the 4-digit SIC codes in which your report is currently classified is printed on the front of your report form (see part B, paragraph 6). It should be noted that the industry group descriptions were designed to include a variety of related manufacturing activities and will not necessarily describe the specific product manufactured by your reporting unit.

We ask that you carefully review both your industry group description and SIC code to determine the accuracy of our classification of your report. If you feel that another industry group would better identify your reporting unit's primary manufacturing activity, please list it (them) in the "REMARKS" section on the back of your report form.

See Illustration for Reporting of Data on Page 4 and 5

### Port B - HOW TO REPORT - Continued

**6.** Reporting of doto — The following illustration has been included to assist you in completing your report form. If you have any questions or need additional information, please call Mr. William C. Menth on (301) 763—2502.

# Standard Industrial Classification Code (see Appendix) Census Bureau identification number NOTE. The return address on this standard Census report form does not apply to all M-3 report forms. To assure that your completed form arrives on time, please use the preaddressed return envelope. If you misplace the preaddressed envelope, return your form to the Washington, D.C. address in Part A, section C. Name and telephone number of person to contact at your company regarding this report Mark the box which best describes current reporting period (See section B.4.) Compare figures for current and previous periods. Correct previous periods if wrong. Explain substantial differences in "REMARKS" (See section B.2 and B.3) Industry group description (See appendix) -For each item listed in column (a), enter the figure in thousands of dollars in column (d)

NOTE. Asterisks will appear in column (e) and or (f) if

Please enter figures for both current and previous periods

figures were not received when this form was printed.

if now available and not previously submitted.

#### Part C - DEFINITIONS AND INSTRUCTIONS

NOTE: The instructions below apply to Forms M3, "Manufacturers' Shipments, Inventories, and Orders," M-3-1, "Manufacturers' Shipments and Orders," and M3-2, "Manufacturers' Inventories."

#### ▶ 1. Scope of the Survey

This survey has been designed to cover the manufacturing activities of companies engaging in significant amounts of manufacturing. Some activities not normally considered manufacturing, such as printing and publishing, apparel jobbers and fertilizer mixing, are considered to be manufacturing activities. Furthermore, whenever possible, you should exclude such nonmanufacturing activities amining, wholesale and retail activities (except sales branches), and research and development. Manufacturing activity which takes place outside the United States should also be excluded. Whenever possible, divisional reporting rather than consolidated reporting is preferable if divisions of your company are engaged in diverse activities.

#### ▶ 2. Definitions

Item code 1000 — Shipments or Net Sales — Include total company billings net after discounts and allowances exclusive of nonmanufacturing activities. Include sales of products and services to other companies, individuals, U.S. Government agencies, and foreign customers. Sales by foreign subsidiaries should be excluded. Transfers within the reporting unit should also be excluded. Transfers to other reporting units should be included.

Item Code 2000 - Net New Orders Received (New Orders Received Less Concellations) - Include (a) the sales value of orders received during the reporting period for products and services to be delivered at some future date; (b) the sales value of orders for immediate delivery which have resulted in sales or shipments during the reporting period; (c) the net sales value of contract change documents which increase or decrease the sales value of the orders to which they are related when the parties concerned are in substantial agreement as to the amount involved. Include as orders only those orders that are supported by binding legal documents, such as signed contracts, or letter contracts. In the case of letter contracts the full amount of sales value should be included if the parties concerned are in substantial agreement on this amount, otherwise, only the funds specifically authorized to be expended should be included. Deduct the sales value of partial or completed cancellations of existing orders.

#### Part C - DEFINITIONS AND INSTRUCTIONS - Continued

Item code 3000 — Unfilled Orders, End of Month — Include orders that have not yet passed through the sales account. Generally, unfilled orders at the end of a reporting period are equal to unfilled orders at the beginning of the period, plus new orders net of cancellations received during the period, less net sales.

Item code 9000 - Total inventory, End of Month -Include the book value - by whatever method derived - as carried on your books of all goods owned by you, wherever located in the U.S. and at all stages of fabrication. Do not include inventories of foreign subsidiaries. The inventories should include goods held at sales branches. Do not include goods for which the title does not lie with you such as Government or customer-owned goods. Goods-in-transit should be included only if you have taken title. Inventories should be reported gross of progress or partial payments. Where possible, a notation of the amount of such payment should be made in the "REMARKS" section (also see Part C, paragraph 3).

- •Item code 9001 Moterials and Supplies Include all raw and semifabricated commodities and supplies, the titles to which have passed to you but which have not yet undergone any processing by you.
- •Item code 9002 Goods in Process Include all commodities undergoing fabrication within your plants.
- Item code 9003 Finished Goods Include all products on which your processing has been completed and which are ready for shipment to customers. Also include all stocks of goods bought for resale without further processing.

Companies reporting inventories on the last-in-first-out(LIFO) method:

- Item code 9010 Dollar value of the non-LIFO portion of total inventories reported in item code 9000.
- Item code 9020 Dollar value of the LIFO portion of total inventories reported in item code 9000.

NOTE: Item 9010 plus 9020 should equal 9000.

•Item code 9030 - LIFO reserve associated with LIFO portion of inventories (item 9020).

Companies reporting inventories on the standard cost method:

- •Item code 9040 Dollar value of total inventories (item code 9000) valued by any method other than the standard cost method.
- Item code 9050 Dollar value of total inventories (item code 9000) valued by the standard cost method.

NOTE: Item 9040 plus 9050 should equal 9000. Has one or more of the standards used to value inventories on standard cost (item code 9050) changed since last month?

'ES N

•Item code 9060 — If yes, please revalue the units in the (current month) inventory with the standards used for the (previous month) valuation

Companies reporting inventories on the LIFO and standard cost methods:

- Item code 9020 Dollar value of the LIFO portion of total inventories reported in item code 9000.
- •Item code 9050 Dollar value of total inventories (item code 9000) valued by the standard cost method.
- Item code 9070 Dollar value of total inventories (item code 9000) valued by any method other than LIFO and standard cost.

NOTE: Item 9020 plus 9050 plus 9070 should equal item 9000.

 Item code 9030 — LIFO reserve associated with LIFO portion of inventories (item 9020).

Has one or more of the standards used to value inventories on standard cost (item code 9050) changed since last month?

res n

•Item code 9060 — If yes, please revalue the units in the (current month) inventory with the standards used for the (previous month) valuation.

Item code 9005 — Inventories Held of Petroleum Bulk Terminols — Include in item code 9005 the book value of inventories of petroleum products of your company held at bulk terminals. These inventories should be excluded from the value of inventories reported by the refineries in item code 9000.

#### Part C - DEFINITIONS AND INSTRUCTIONS - Continued

#### 3. Special Reporting Instructions for Shipbuilding ond Aircroft and Aerospace Industries

#### a. Shipbuilding and Repairing

#### Value of shipments (Item code 1000)

For ships (under construction) report value of work done during the month in item code 1000. For vessels begun earlier than the month or not completed during the month, report only the value of work done during the month. Value of work done this month may be based on (a) multiplying the estimated percentage of work completed during the month by the contract price of the vessel, or (b) net billings for work done during the month.

Please indicate in the "REMARKS" section of this form the method chosen to report these data.

#### Inventories (Item codes 9000, 9001, 9002, 9003)

Inventories should be reported at approximate current costs, if feasible; otherwise at book values. In addition, work-in-process inventories should reflect value of work done but which has not been reported as a shipment by any of the methods listed in the paragraph above.

### b. For Producers of Complete Aircroft and Missiles

#### Value of Shipments (Item code 1000)

Producers of these items should report the value of shipments during the month on complete aircraft, missiles, space vehicles and missile or space vehicle engines in item code 1000. This figure should reflect shipments based on delivery for work being done on a fixed price contract.

Work done on a cost-plus contract should reflect cost incurred (value of work done) during the month. Value of work done this month may be based on (a) multiplying the estimated percentage of work completed during the month by the contract price of the aircraft or missile.

or (b) net billings for work done during the month.

Please indicate in the "REMARKS" section of this form the method chosen to report these data.

#### Inventories (Item cades 9000, 9001, 9002, 9003)

Inventories should be reported at approximate current cost, if feasible; otherwise at book value. Additionally, in order to determine the levels of raw materials, work-in-process and finished goods inventories supporting aircraft production, aircraft producers are requested to report as follows:

- Aircraft missiles, etc. produced under fixed price contract should be reported as workin-process inventories as the work is performed. Upon completion of the contract and/or shipment of the item, the amount of the contract or item would be deducted from work-in-process inventory account.
- For aircraft missiles, etc. produced under a cost-type contract, only relatively small values should be reported in work-in-process inventories since most of the costs incurred have been reimbursed by the customer.

## ▶ 4. Special Reporting Instructions for Defense Industries

Reports received for five of the 79 industry groups in this survey are tabulated as either defense or nondefense. These groups are Ordnance, Communication Equipment, Complete Aircraft, Aircraft Parts, and Shipbuilding and Military Tank Vehicles (see Appendix). If the industry description printed on the front of your form is one of the above, please be sure that it is also properly classified as either defense or nondefense. To be classified as defense; your manufacturing activities should be predominately for shipments to or for work done for the Department of Defense (either as a prime or subcon-NASA, ERDA, or any other Federal agencies are considered as nondefense. If the description preprinted on your form does not properly describe your report, please state this in the 'REMARKS' section on the back of the form.

<sup>(</sup>NA) Not available. Separate seasonal factors for the industries tabulated in defense and nondefense components fordnance, communication equipment, aircraft parts, and shipbuilding and motor vehicles and parts are not shown in this table. These industries are independently adjusted, but published in aggregate only.

#### APPENDIX E. Average Percentage Changes and Related Measures for Series Components

efinition of Summary Measures— The following are brief finitions of the measures shown in this appendix. More implete explanations appear in Electronic Computers and issues Indicators, by Julius Shiskin, issued as Occasional per 57 by the National Bureau of Economic Research, 1957 sprinted from the Journal of Business, October 1957).

"O" is the average month-to-month percentage change, thout regard to sign, in the original series. "CI" is the same r the seasonally adjusted series. "I" is the same for the egular component, which is obtained by dividing the cyclical mponent into the seasonally adjusted series. "C" is the same the cyclical component which is a smooth, flexible moving grage of the seasonally adjusted series.

"LHC" denotes the length of the Henderson Trend-cycle. If irregular movements are small relative to the cyclical wements, then a short moving average will be selected (9 or 13 m). If the irregular movements are large relative to the cyclical wements, then a longer moving average will be selected, (23 m).

"I/C" is the average relative month-to-month change, without ard to sign, of the irregular component divided by the rage relative month-to-month change, without regard to sign, the cyclical component. It serves as an indication of the es' relative irregularity.

"MCD" represents months for cyclical dominance. The rage without regard to sign percentage changes in the gular component and cyclical component are computed for nonth spans (January to February, February to March, etc.,) nonth spans (January to March, February to April, etc.,) up 5 month spans. MCD is the shortest span for which the rage change (without regard to sign) in the cyclical com-

ponent is larger than the average change (without regard to sign) in the irregular component. Since changes are not computed for spans greater than 5 months, all series with an MCD greater than 5 are shown as 6. MCD is small for smooth series and large for erratic series.

"Average duration of run" is a measure of smoothness, and is equal to the average number of consecutive monthly changes in the same direction in any series of observations. When there is no change between 2 months, it is assumed that "no change" is a change in the same direction as the preceding change. The average duration of run is shown for the seasonally adjusted series CI, irregular component I, cyclical component C, and the MCD moving average. The MCD moving average is a moving average with the number of terms equal to MCD of the seasonally adjusted series.

"F-test"- The standard methodology for testing whether a series demonstrates stable seasonal fluctuation is the "F-test." In essence this test compares "between months" variance of the seasonal-irregular ratios (the original series divided by the trend-cycle fluctuation) against all other variance (residual variance) of the seasonal-irregular ratios. F is equal to the "between months" variance divided by the "residual" variance. If the computer F is greater than 2.41 (the 1 percent value for a 10-year series from a tabbed F-distribution), stable seasonality is present. This test demonstrates some shortcomings in identifying the presence of seasonality in only one month, or in identifying seasonality in a series that undergoes moving or changing seasonal patterns. These summary measures include a statement as to whether or not the "F-test" has been passed. In either event, the derived seasonal factors have been used to adjust the component series.

Source: The statistics in this table are based on industry totals published in the 1958-1976 Censuses of Manufactures and Annual Surveys of Manufactures. From 1958 to 1971, the census and annual survey data were tabulated according to the 1972 SIC. The conversion of the 1978 to 1971 data to the 1972 SIC is described in the MA-1,6 report, "Manufacturers" Shipments, Inventories, and Orders, 1958-1976, Revised", which was published in December 1976. Detailed conversion tables are shown in Appendix H of that publication.

### APPENDIX H. Value of Manufacturers' Inventories, by Industry Group and Stage of Fabrication: 1958-1976 (in millions of dollars. Based on 1972 Standard Industrial Classification)

annual survey data were tabulated according to the 1967 Standard Industrial Classification (SIC). From 1972 to the present, the data were tabulated according to the 1972 SIC. The conversion of the 1972 SIC is described in the MJ-1.6 report, "Manufacturers' Shipments, Inventories, and Orders, 1958-1976, Revised", which was published in December 1970. Detailed conversion in Appendix H of the Doblication.

Industry Division
Milton Eisen, Chief

ACKNOWLEDGMENTS—This report was prepared under the direction of Milton Eisen, Chief of the Industry Division. John R. Wikoff, Assistant Division Chief for Current Programs, provided overall guidance for this report.

Within the Industry Division, the preparation of this report was performed under the supervision of Ruth Runyan, Chief, Shipments, Inventories, and Orders Branch, assisted by Kathleen Swindell. Other contributing industry analysts include Stephen Andrews, Hubert Calderon, Craig Chason, Ronald Danna, Willis Freeman, Henry Haurand, Jasse Havard, Laurie McKenna, Mattie Norwood, David Peterson, Richard O'Sullivan, Ruth Renwick, Clive Richmond, and Charles Wisniewski. The assistance of Gladys Archer, David Cooper, Grace Daly, Deborah Dove, Norman Dyson, Rose Fleming, Rosella Geary, Ann Johnson, Catherine Knudsen, Lorrine Mitchell, Karen Taylor, and Elizabeth Witcher is also appreciated, as is that of Lillie Mae Skinner who coordinated the various phases of the publication process.

The electronic computer programs were developed under the direction of William Norfolk, Assistant Chief for Operations. Albert Ginsberg and Jack Wasil developed the computer editing and tabulation programs under the direction of Jerry Bell.

Finally, a special acknowledgment is due to the many businesses whose cooperation was essential to the success of this report.

Address inquiries concerning this report to the U.S. Department of Commerce, Bureau of the Census, Industry Division, Washington, D.C. 20233, or call Ruth Runyan or Kathleen Swindell, (301) 763-2502.

### SUGGESTED CITATION

U.S. Bureau of the Census, Manufacturers' Shipments, Inventories, and Orders: 1967-1978 M3-1.8 U.S. Government Printing Office, Washington, D.C. 1978.

For sale by the Subscriber Services Section (Publications), Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce district office. Postage stamps not acceptable; currency submitted at sender's risk. Remittances from foreign countries must be by international money order or by a draft on a U.S. bank. Price \$2.00 per copy.

### I. INTRODUCTION

The monthly seasonally adjusted data in the Current Industrial Reports Series, M3, Manufacturers' Shipments, Inventories, and Orders, 1958 to 1978, have been revised to reflect

the updating of the seasonal adjustment factors resulting from the addition of the 1978 survey data. Some of the unadjusted historical series were revised to include corrections for minor reporting and/or processing errors. Corrected series are shown in the table below.

### INDUSTRY SERIES WITH HISTORICAL CORRECTIONS TO THE SEASONALLY UNADJUSTED DATA

Industry	Shipments	New orders	Unfilled orders	Inventory total	Stage of fabrication
				×	X
Nonferrous metal products	×	×	×		
Fabricated metal products	<b> </b>	l $\hat{x}$	×	1	
Electrical machinery	<u>`</u>	1	1		
Electronic components	×	×	X	<u> </u>	
Transportation equipment	X	X	X		
Aircraft, missiles, and parts	×	X	X		
All other durable goods	l x	×	×	X	X
	×	l x		X	X
Chemicals and allied products	l x	×	1		
Petroleum and coal products	_ ^		l x		
Defense capital goods		X	1 "		
Nondefense capital goods	X	l ×	1 ×		

The next monthly report issued in the M3 series will be consistent with the revised data shown in this publication. The methodology followed in updating the seasonal adjustment factors is the same as that used for the 1977 annual benchmark publication.

The data included in this report are limited to the years 1967 to 1978. Although data for 1958 to 1966<sup>1</sup> were included in the calculations of the seasonal factors, no significant revisions to the seasonally adjusted monthly estimates for those years resulted. Data for all published industry categories, 1958 to 1978, are available for purchase on computer tape through the Data User Services Division, Bureau of the Census.

### II. SUMMARY OF REVISIONS

Revisions to the previously published seasonally adjusted M3 data, resulting from the addition of 1978 survey data to the calculation of seasonal adjustment factors, are generally small. With the exception of corrections to the aircraft and parts industry, revisions to the seasonally unadjusted data are also small. Both the defense and nondefense components of the aircraft and parts industry were affected by reporting errors in shipments, new orders, and unfilled orders. In addition to corrections for reporting errors, the commercial, or nondefense, component of unfilled orders for complete aircraft was systematically revised to reflect a change in the implicit weighting

<sup>1</sup> See Current Industrial Reports M3-1.7, Manufacturers' Shipments, Inventories, and Orders: 1958-1977.

of manufacturers of small aircraft versus manufacturers of larg aircraft. The total effect of these revisions for the industry fo 1978 is an average monthly reduction in new orders of 10.5 percent, in shipments of 9.5 percent, and in unfilled orders o 3.7 percent.

The total effect of revisions to the seasonally adjusted dat for all manufacturing industries for 1978 was an average of 0.7 percent per month for new orders, 0.54 percent per month for shipments, 0.83 percent per month for unfilled orders, and 0.1 percent per month for inventories. Data revisions for all major industry groups for 1976 to 1978 are summarized in the table on page IX.

### III. SEASONAL ADJUSTMENT METHODOLOGY

The monthly data on shipments, inventories, and unfilli orders are adjusted for seasonality at the most detailed lev tabulated in the survey using the X-11 variant of the Cens Bureau's seasonal adjustment program.<sup>2</sup> Seasonally adjusting industry aggregates are derived by adding seasonally adjusticomponents rather than by direct seasonal adjustment of taggregates. New orders data are similarly derived from t

<sup>&</sup>lt;sup>2</sup> Documentation of this program can be found in Electronic Coputers and Business Indicators, National Bureau of Economic Reseal Occasional Paper 57 (New York, 1957); Tests and Revisions of Bure of the Census Methods of Seasonal Adjustments, Bureau of the CenTechnical Paper No. 5 (Washington, 1961); The X-11 Variant of Census Method II Seasonal Adjustment Program, Bureau of the CenTechnical Paper No. 15 (Washington, 1967).

<sup>(</sup>X) Not applicable

Revisions to the transportation equipment industry are due almost entirely to revisions in the seasonally unadjuated levels of shipments and unfilled orders the aircraft and parts industry. These revisions were a result of reporting errors by aircraft companies.

seasonally adjusted shipments and unfilled orders data in the same manner as the unadjusted estimates. (See section IV B below.)

### A. The X-11 Variant Approach

The X-11 variant of the seasonal adjustment program provides (1) improved techniques over the earlier versions of the program for the treatment of extreme observations and (2) a regression program to identify adjustments for the variations in the number of trading days per month. Use of the trading day routine, however, is optional and is not used in the M3 survey. Instead, shipments data in the individual reports are adjusted prior to tabulation for the number of trading days as well as for variations in the length of the reporting period.

Appendixes C through E provide the historical and current trading-day adjustment factors, the forecasted monthly seasonal factors<sup>3</sup> for use in 1979, and summary measures used in evaluating the seasonal patterns for the industry categories.

### B. Trading-Day Adjustment Factors

Variation in the rate of activity that arises from the existence of different numbers of trading days in the same month for different years can be an important cause of month-to-month irregular fluctuations. Unlike some other causes of irregular fluctuations (such as unexpected economic developments, unusual weather, and statistical errors), trading-day irregularities can be approximately identified and removed so that the underlying trend-cycle stands out more clearly. Hence, it is often possible to reduce the irregular factor by a trading-day adjustment.

As noted earlier, the M3 survey does not use the trading-day adjustment option in the X-11 program, but rather adjusts the shipments data for monthly trading-day variations in the individual reports prior to tabulation. At the same time, the reports are adjusted for variations in the length of the report periods of companies. In effect, all reports are adjusted to reflect manufacturing shipments for one-twelfth of a year, or a standard month of approximately 26 trading days.

Considerations used in selecting trading-day adjustment factors are knowledge concerning industry practices, tests of alternative sets of factors, and derivations of trading-day factors based upon the information contained within the data. For most series, the development of monthly trading-day adjustment factors is based upon the assumption of equal weights for Monday through Friday, half-weight for Saturday, and half-weight for Sunday. The logic for this trading-day pattern rests on the assumption that (1) the books in which sales records are kept are generally open Monday through Friday and that (2) about half of the sales volume each month takes place with monthly periodicity independent of the vagaries of the month-end calendar. In allowing for this

half of the sales volume, equal treatment is given to Saturday and Sunday. For further discussion of the trading-day factor selections, see the notes to appendix C.

### C. Special Adjustments for Specific Series

The routine X-11 procedure for the treatment of extreme values was used to adjust shipments data for strikes and other irregularities, except in the steel and the automotive industries.

- 1. Steel Industries. In the steel industry, a strike, or the anticipation of a strike, has occurred every 3 years. This has altered the seasonal pattern for shipments, inventories, and orders data in these periods by creating a general pattern of heavy ordering before the strike or settlement and a weak ordering rate afterwards. To eliminate the effects of these irregular movements from the calculations of the seasonal adjustment factors, data for the years in which a strike either occurred or had been anticipated were excluded from the original data series. A pseudo series was then constructed using a beginning link point of December 1958 and the monthly ratios of change of the following years' data. After seasonally adjusting this pseudo series, the excluded years were reintroduced, with the seasonal factors for these years estimated to be the average of the preceding and following years' factors.
- 2. Automobile Industries. The seasonal adjustment of shipments data for automotive assembly operations presents a special problem. Each year the automotive assembly plants suspend operations to retool assembly lines for the next model year. This results in enormous fluctuations in the July, August, and September data, which do not always occur in the same month or with the same magnitude. Seasonal adjustment, therefore, cannot be done during these months in the usual manner, and a special procedure is used. As the model changeover period usually takes place entirely within this 3-month period, the problem of the timing of the changeover was removed by modifying the input data to the seasonal adjustment program as follows. Shipments estimates for July, August, and September were developed based on production estimates published in advance by the industry. These estimates were then averaged, and the altered automotive series, i.e., with July, August, and September equal to each other, were seasonally adjusted. The seasonally adjusted estimates for July, August, and September were then averaged and included, at these August and September no change levels, in the published seasonally adjusted aggregates. An exception to this procedure was carried to the third quarter 1976 data, where a special adjustment for the August through September strike was made. (For the published seasonally unadjusted automotive data series, the original, or reported data, are included in the aggregates.)
- 3. Defense-Oriented Industries. Beginning in 1976, the fiscal year for the Federal Government was changed from a July 1 through June 30 basis to an October 1 through September 30

<sup>&</sup>lt;sup>3</sup>The seasonal factors as generated by the X-11 program are calculated as the algebraic sum of the previous year's (1978) factor for a particular month and one-half the difference between the previous year's (1978) factor and the 2-year-ago (1977) factor for that month.

<sup>&</sup>lt;sup>4</sup> The years 1959, 1962, 1965, 1968, and 1971 were excluded from the seasonal factor calculations. Data for 1974 and 1977 were retained, since early settlement of the strike in those years resulted in only minor irregular fluctuations in the data.

basis. The change probably affected the timing of purchases and the awarding of contracts. Although the impact of this change is not known, the use of previously established seasonal patterns would have substantially distorted the current data on new and unfilled orders, since these seasonal factors reflect historical Government purchasing patterns. To compensate for this shift in seasonality, a set of composite seasonal factors for unfilled orders was developed for the defense components of the communications equipment, aircraft, aircraft parts, shipbuilding and ordnance industries for the period May 1976 through September 1977. The composites are based on an averaging of each month's seasonal factor (as normally calculated in the X-11 program) with the factor for the third month following, i.e., one quarter later. For example, if the adjustment factor for defense aircraft for November 1975 was 102.7 and for February 1976, 99.8, the factor used for seasonally adjusting February 1977 data would be 101.2.

The resulting set of composite factors for the period October 1976 through September 1977 is being used for succeeding fiscal years, pending the availability of sufficient data to assess the impact of the change in the fiscal year on the seasonal pattern of the defense industries. Also, the use of these composite seasonal factors modifies the derived new orders data for the defense series. (See section IV B below.) Similar adjustments could not be made for nondefense Government orders since such data are not compiled separately.

### IV. DESCRIPTION OF SURVEY

The Manufacturers' Shipments, Inventories, and Orders survey provides broad-based monthly statistical data on economic conditions in the domestic manufacturing sector. It is designed to measure current industrial activity and to provide an indication of future trends. The data are used extensively by the executive branch of the Government in developing economic, fiscal, and monetary policy; by the Bureau of Economic Analysis (BEA) as components of the gross national product estimates; and by trade associations, corporate economists and other members of the business community as an analytical tool in their assessment of the current and future economic condition of the country.

The M3 shipments and inventory data are comparable to the total published in the annual survey of manufactures (ASM). The ASM is a sample survey of approximately 70,000 manufacturing establishments drawn from a 5-year census of manufactures universe of about 312,000 establishments. In the ASM, each manufacturing location reports data on value of shipments, beginning and end-of-year inventories as well as various other conomic variables.

### 1. Composition of the Survey Panel

The monthly M3 estimates through 1978 are based on infornation obtained from approximately 5,000 reporting units and iclude virtually all manufacturing companies with 1,000 or lore employees, as well as selected smaller companies which re included to strengthen the sample coverage in individual industry categories. For firms which operate in a single M3 industry category, the reporting unit typically comprises all

operations of the company. At the request of the Census Bureau, most large, diversified companies file separate reports for divisions which operate in different industrial areas.

Each company or division of a company in the sample is classified into one of 79 industry categories for which separate estimates are made (see appendix A) based on the major activity of the reporting unit. Some reporting units include industry activities outside the M3 category in which they are classified. The survey methodology assumes that the month-to-month changes of the reporting units classified in each industry category effectively represent the month-to-month movements of the establishments in the SIC industries which comprise the category.

The sample selected in 1962 for this survey included all companies with more than 1,000 employees. Smaller companies were sampled proportional to their employment size. Because of poor response rates, reporting by companies with less than 100 employees was discontinued in 1963 and, instead, data for these companies were estimated by using overall industry averages. In the following years, work continued on obtaining divisional reports from large, diversified firms and on obtaining voluntary participation of all firms with 1,000 or more employees. This effort was intensified in the early 1970's as additional funding was made available. Virtually all such companies now report.

There was also some deterioration in response rates for companies with between 100 and 999 employees. Therefore, in January 1975 a supplemental sample of approximately 1,000 companies was selected from the universe of companies in this size range in order to strengthen the estimates. Approximately 60 percent of the companies from this supplemental sample are now reporting, and their reports are included in the monthly estimates beginning with January 1978.

### B. Monthly Estimation Procedure

The monthly estimates of shipments, unfilled orders, and total inventories are derived for each industry category by multiplying the industry estimate for the previous month by the percentage change from the previous month for companies reporting in the current month.<sup>\$\$</sup> The previous month's data for an individual firm may either be reported by the firm or 'imputed' by the Census Bureau. This is a change from the procedure used prior to 1975, when reported data for both the current and previous month were required for a company's report to be used in computing the current month's estimate.

From time to time, an individual company report may show unusually large changes from the previous month which differ substantially from the movement shown by the rest of the reporting panel. An example of this is the effect of a strike upon an individual company. Such extreme movements are isolated from the estimation procedure as follows: the data for the individual company are removed from the computation of the aggregate month-to-month percentage change and from the prior month's industry estimate; the modified percentage

<sup>&</sup>lt;sup>5</sup>This procedure is explained in greater detail in Series M3-1, Manufacturers' Shipments, Inventories, and Orders, 1947-1963 (Revised).

change is then applied to the reduced prior month's estimate, giving a current month's estimate of the entire industry excluding the company with the unusual month-to-month change; finally, the company's reported data are added to the modified current month's estimate to obtain the estimate for the entire industry. The effect of this procedure is to restrict the basis of estimation for nonrespondents and firms not in the survey panel to the general trend of the industry.

The seasonally adjusted estimates for each M3 industry category are calculated by dividing the unadjusted estimates by a seasonal adjustment factor previously computed by the X-11 seasonal adjustment program (see section III above.)

Though collected as a separate item, new orders are not calculated according to the standard ratio-estimate procedure. The reason for this is that not all companies report new orders; and some that do report this item limit their reporting to specific products for which long lead times are required in the production cycle. These companies, in effect, exclude new orders received for products that are shipped from inventory. To take advantage of the higher response rate for shipments data and to include orders filled from inventory, new orders are computed by adjusting the current month's shipments by the change in the backlog of unfilled orders. Thus, the estimate of new orders includes orders that are received and filled in the same month as well as orders that have not yet been filled. Also included are the effects of cancellations and modifications of previously reported orders.

Seasonally adjusted new orders are computed by adding (or subtracting) the difference in the seasonally adjusted unfilled orders for the current month from the previous month to the current month's seasonally adjusted shipments. This procedure preserves the definitional identity between shipments, unfilled orders, and new orders, although it will yield seasonally adjusted new orders estimates which differ slightly from an independent seasonal adjustment of new orders.

The estimation of total inventories follows the procedure previously described. However, because a significant number of companies that report total inventories cannot report inventories by stage of fabrication, a modified procedure is used to estimate the stage-of-fabrication data. In this procedure, the inventory totals previously estimated are cumulated to twodigit SIC major group levels and serve as control totals for the stage-of-fabrication data. Initial estimates by stage of fabrication are made for each two-digit SIC based on the link-relative method for reporting companies; the differences between the sum of the stage-of-fabrication detail and total inventories are then allocated proportionally to the stage-of-fabrication figures to form the estimates. Each stage-of-fabrication estimate is adjusted by the appropriate seasonal factor to obtain seasonally adjusted figures; and, once more, the difference between the sum of the seasonally adjusted figure for inventories by stage of fabrication and the seasonally adjusted total inventories is proportionally allocated to the stage-of-fabrication detail.

### C. Corrections of Estimates to ASM Levels (Benchmarking)

Periodically, the estimates of annual shipments and end-ofyear inventories derived from the monthly survey are benchmarked to the annual totals compiled in the census and annual survey of manufactures (ASM). This benchmarking adjusts for any differences that may result from collecting monthly data on a divisional or company basis as compared to the establishment basis used in both the ASM and the census of manufactures. It also corrects for errors of estimation in the monthly survey and for any reporting or processing errors that may not have been detected as part of the review of the monthly estimates. The last benchmark revision was issued in March 1978, at which time the monthly estimates were benchmarked to the annual data through 1976.

The benchmarking process involves comparing the monthly reports with the annual reports (Form MA-100) for individual companies and reconciling large differences. Some differences are to be expected, as the monthly reports are for companies or divisions of companies, while the annual reports are for individual establishments. Corrections are made to the monthly estimates for both response and processing errors. The corrected monthly estimates are then adjusted to the annual benchmark levels for shipments and to the December year-end figures for inventories. In both processes, the objective is to preserve the original month-to-month movements to the extent possible Inventories by stage of fabrication are benchmarked in the same way and then balanced to the total inventories. For both sales and inventories, the data are extrapolated forward for the months following the most recent benchmark year by using the original month-to-month movements. However, corrections are made for individual errors in the monthly movements prior to this extrapolation.

Estimates of unfilled orders have not been benchmarked to the ASM, since data on unfilled orders were not collected in that survey prior to 1976. A complete discussion of the method ology followed in developing the unfilled order levels appears in the benchmark report, M3-1.6, issued in December 1976. In order to develop more reliable backlog levels, a survey was conducted in 1977, requesting the level of unfilled orders as o December 1976. For single establishment companies, thinquiry was included on the regular ASM report forms for 1976. For multiestablishment companies, a separate survey reporform designed to accommodate an entire company's manufacturing activity was used. The results of this survey are still being evaluated. Upon completion, new industry backlog levels will be established and the monthly M3 data bench marked accordingly.

### D. Qualifications of the Data

The monthly data presented in this publication are subject to both sampling and nonsampling errors. Sampling errors occubecause reports are received from a sample rather than from the complete universe of manufacturing companies. Because of the present composition of the sample, the amount of sampline error cannot be quantified. Nonsampling errors, on the othe hand, are attributable to many sources. The use of companior divisional reports to estimate the monthly change for establishments is probably one source of nonsampling error. It addition, response and processing errors may be present, all though it is believed that most of the important errors of this

kind have been detected and corrected in the reasonableness and consistency edit of the data prior to publication.

### V. DEFINITION OF TERMS

### A. Value of Shipments

Value of shipments as reported in the ASM represents net selling values, f.o.b. plant, after discounts and allowances and excluding freight charges and excise taxes. Where the products of an industry are customarily delivered by the manufacturing establishment (such as in certain food industries—fluid milk, bakery products, soft drinks), the value is based on delivered price rather than the f.o.b. plant price. In the annual survey, multiestablishment companies report value information for each plant as if it were a separate economic unit. Thus, products transferred from one plant to another are reported at their full economic value, i.e., in addition to the cost of production, a reasonable proportion of company overhead and profits are notuded.

Included in the value of shipments, in addition to products nade in the establishments, are those made elsewhere under contract from materials of the establishment. Also included are he value of all products sold, transferred to other plants of the ame company, or shipped on consignment. Receipts for conract work performed for others, resales, miscellaneous activities uch as the sale of scrap and refuse, installation and repair work erformed by employees of the plant, and the value of research nd development performed at the plant are also included.

In the snipbuilding industry, the value of work done in a ven year varies considerably from the value of shipments ecause of the long lead time between the start and completion is a large vessel. In the annual survey, therefore, the value of ork done during the year, rather than the value of shipments, included. The same procedure is followed for aircraft projuced on a cost-plus contract. Aircraft produced on a fixed-ice contract are reported in the usual manner when the oducts are shipped. Where value of work done is reported in ace of shipments, the inventories are normally charged to the istomer as costs are incurred and are not reported by the ipyard or the aircraft producer as finished goods inventories.

The value of shipments figures developed from the Annual rivey of Manufactures contain duplication at the all manusturing and industry group levels, since the products of some dustries are used as materials by other industries within the ne industry group. With the exception of motor vehicles, is not significant at the four-digit SIC industry level. Since 19 M3 industry categories typically are groupings of industries, the duplication is significant for all manufacturing, durable pods and nondurable goods categories, and the various market grups. The significance of the duplication within the specific industry categories varies depending on their four-digit in ustry composition. It is most pronounced in a few highly integrated industry areas, such as primary metals and motor valicles and parts.

For multiunit companies, the M3 reports received each not not establishment reports but are company d'divisional" level reports that encompass groups of establiments. The actual sales reported are usually net sales and

receipts from customers and exclude the duplication of interplant transfers. These reported sales are used to calculate the month-to-month changes which bring forward the establishment-based shipments for the industry category.

### B. Inventories

End-of-month inventories are identical in definition to the end-of-year inventories in the annual survey of manufactures. In the annual survey of manufactures, respondents are asked to report inventories of individual establishments at book value by whatever method derived. Since different methods of inventory valuation are used (LIFO, FIFO, etc.), it should be emphasized that the definition of the aggregate inventories for establishments in an industry is not precise.

Inventories are reported by stage of fabrication: (a) finished goods; (b) work in process; and (c) materials, supplies, fuel, and other inventories. In using inventories by stage of fabrication at the all manufacturing and two-digit SIC major group levels, as well as for the durable and nondurable goods sectors, it should be noted that a finished product of one industry may be a raw material for another industry at the next stage of fabrication. Insofar as the durable and nondurable goods sectors and also the two-digit major groups contain industries with successive stages of processing, the same type of inventories may be included under different stage-of-fabrication categories in the aggregate statistics.

In some industries, there are special problems in measuring inventories by stage of fabrication. These are industries in which products are stored under controlled conditions and where products are aged, such as in the tobacco, whiskey, and cheese industries. It is not clear whether such products should be treated as finished goods or as work in process. In all these industries, substantial finished goods inventories have been reported in the annual survey of manufactures. These data have been summarized in the inventory tables in a consistent manner for all the annual survey of manufactures years used as benchmarks for the M3. The inventories reported in the M3 for each type of inventory are used to bring these end-of-year inventories forward each month. Even if there are inconsistencies in the company or divisional level inventories by stage of fabrication compared to the annual survey of manufactures establishment reports, the month-to-month data which are used to determine the ratio of change are consistent within themselves.

### C. New Orders Received and Unfilled Orders

Orders as reported in the monthly survey are net of cancellations during the month of orders previously reported. They include orders received and filled during the period as well as orders received for future delivery. They also include the net sales value of contract changes which increase or decrease the sales value of the unfilled orders to which they relate. Orders are defined to include only those supported by binding legal documents such as signed contracts, letters of award, or letters of intent, although in some industries this definition may not be strictly applicable. In case of letters of intent, the full amount of the sales value is included if the parties are in substantial agreement on the amount; otherwise, only the funds specifically authorized to be expended are included.

Unfilled orders include orders as defined above that have not been reflected as shipments. Generally, unfilled orders at the end of the reporting period are equal to unfilled orders at the beginning of the period plus net new orders received less net shipments.

### D. Composition of Industry Categories

The 79 industry categories used in the survey are groupings of four-digit SIC industries as defined in the 1972 Standard Industrial Classification Manual<sup>6</sup> as amended. The definitions are shown in appendix B.

The coverage for many of these 79 categories is not sufficient to warrant publication of the data. In addition to limitations imposed by the size of the sample, coverage is reduced for some groupings as a consequence of consolidated reporting by some multiunit companies. A company which reports on a consolidated basis (either the entire company or a division) is included only in the M3 category in which the reporting unit as a whole is classified. Therefore, in the monthly estimates, its combined activity influences only the movement of that industry category and has no influence on the movement of the other industries included in the combined report. As a result, it has been necessary to combine these 79 industry categories into 44 publication levels (16 SIC two-digit major groups or combinations of two-digit major groups plus 28 additional categories) for shipments and total inventories. In presenting orders and inventories by stage of fabrication, it has been necessary to introduce further combinations because of the lower response rates for those items.

1. Market Categories. In addition to presenting data for industry categories within the two- and three-digit SIC groups, the M3 also presents the basic data in terms of markets. These groupings are designed to (a) separate shipments of final products from shipments of semifabricated products and materials for further manufacture or by use by the construction industry, and (b) to distinguish finished goods productions as to durability and between consumer-type products and equipment items. Such economic time series provide useful measures of isolating the impact of changes in demand in various sectors of the economy and greatly facilitate analysis of cyclical and growth developments.<sup>7</sup> The market grouping categories provide a further division of final products between consumer goods and equipment for business and government use.

Within the consumer goods category, subtotals are provided for home goods and apparel, and for consumer staples. Materials, including supplies and intermediate products, are subdivided into construction materials and all other. For reasons to be discussed later in this section, automotive equipment is treated as a separate market grouping. The industry composition of the market groupings is shown in appendix B.

<sup>6</sup> The SIC, as developed in the Office of Management and Budget by the Technical Committee on Industrial Classification, classifies establishments to the four-digit industry level by principal type of activity therein engaged.

In determining the four-digit industry composition of the basic M3 industry categories, the desirability of aggregating data into the two-digit and three-digit SIC groups and into market categories was an important consideration. The extent to which separate tabulation categories could be formed had to be reconciled with the limits imposed by the sample and the reporting capabilities of multi-industry companies. Generally, industries within the same three-digit group were treated as a unit unless there were strong indications that a separate category could be set up for a single four-digit industry or combination of industries within the three-digit group.

The market grouping series is very valuable in the presentation of the monthly industry survey data. However, there are certain qualifications which should be taken into consideration when using the figures. Foremost is the fact that the SIC system, which is basic to the monthly survey, is an industry rather than a product classification system. For this reasonthe classification system yields only approximate groupings for marketing purposes. Frequently the industry structure does not distinguish between finished goods which are sold to the consumer and the business markets, and intermediate product which are to be incorporated in final products by other industries.

With one exception, the market grouping categories permi direct comparisons to be made with Federal Reserve Board market groupings in use prior to 1971. The major difference in the two series is the treatment of motor vehicles and part which is shown as a separate category in the monthly industry survey. In the Federal Reserve Board Index of Production, thi category is spread among three groups. The Federal Reserv-Board classifies all passenger automobiles and motor vehicle replacement parts in consumer goods, along with automobiltrailers, boat building, motorcycles and bicycles. Trucks and buses are classified in equipment and motor vehicle parts fo original equipment and materials. The monthly industry survey reports do not separate the value of cars and trucks and i would be most difficult to parallel the Federal Reserve Board categories in this respect. The Federal Reserve Board revises its series in 1971.

2. Supplementary Series. In addition to the market categories there are two supplementary series: household durable good industries and capital goods industries. The capital good industries category is further subdivided into two components defense and nondefense. These categories are useful in bringin together industries that are subject to the influence of distinc economic forces and exhibit unique patterns in shipments

<sup>&</sup>lt;sup>7</sup>The advantages of using market groupings in economic analysis have been described at greater length in the Federal Reserve Board publication, Industrial Production, 1971 Revision.

<sup>&</sup>lt;sup>8</sup> Household durable goods industries — Household furniture; kitche articles and pottery; cutlery, handtools and hardware; household applances; opthalmic goods, watches, clocks, and watch cases; and micellaneous personal goods.

<sup>&</sup>lt;sup>9</sup> Capital goods industries: Nondefense products — Machinery, except electrical (excluding farm machinery and equipment and machine shops electrical machinery (excluding household appliances, radio and TV, an electronic components); railroad equipment; and the nondefense portion of shipbuilding and military tank vehicles, communication equipment aircraft, aircraft parts, and ordnance. Defense — Shipbuilding and military tank vehicles, communication equipment, aircraft, aircraft parts, ar ordnance.

inventories, and orders. Seasonal factors are presently developed directly from the historical data of the separate defense and nondefense portion of the ordnance, communication equipment, complete aircraft, aircraft parts, and shipbuilding industries. The separation of each industry into defense and nondefense components from January 1968 forward in no way compromises the historical comparability of the total industry without seasonal adjustment. However, the data user should be cautioned that the comparability of the seasonally adjusted series demonstrates a potential break, particularly in the year 1968, due to the separate seasonal adjustment of defense and nondefense components of each industry.

### VI. 1978 INVENTORY VALUATION SURVEY

### A. Background

Data on the value of year-end inventories, tabulated by the various inventory valuation methods, have been updated with information collected on the 1978 Inventory Valuation Survey. This annual survey supplements the book value end-of-year nventory data published in the monthly Manufacturers' Shipments, Inventories, and Orders Report (M3).

An inventory method-of-valuation survey was first conducted n 1975, covering valuation practices followed by large companies in 1974 and 1973. Results of that first collection effort were inadequate and, consequently, were not published. The survey has subsequently been conducted on an annual basis, and the results of the 1976 through 1978 surveys are shown in table A. The percentages for 1977 are revised from those previously published in the June 1978 report to reflect revisions eceived from responding companies. Data for 1975 have been smitted from this table due to a lower response rate than in the ubsequent surveys.

In the Inventory Valuation Survey, companies were asked to eport the percentage of their December inventories, as reported n the M3 Survey, valued by the following accounting methods:

- 1. First-in, first-out (FIFO)
- 2. Last-in, first-out (LIFO)

- Average cost
- 4. Specific or actual cost
- 5. Standard cost
- 6. Other cost methods
- 7. Market valuation methods always used
- Market valuation used because market value was lower than cost
- 9. Other market methods

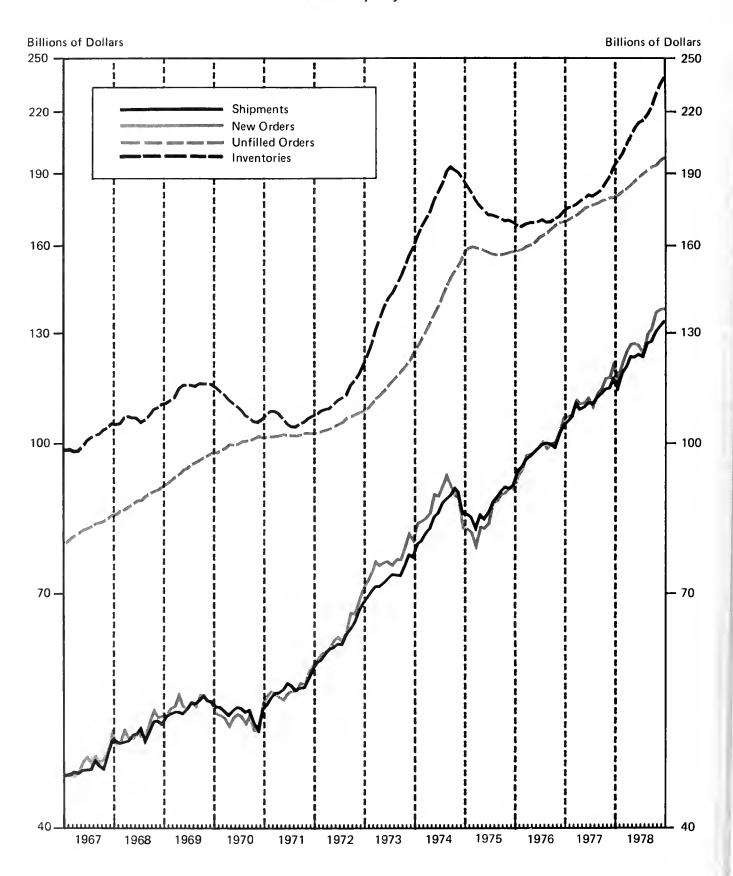

The last four methods were collected separately, but combined for publication purposes. Where individual methods in this aggregate are significant for particular industry categories, the figures are shown in the footnotes to the table.

### **B.** Methodology

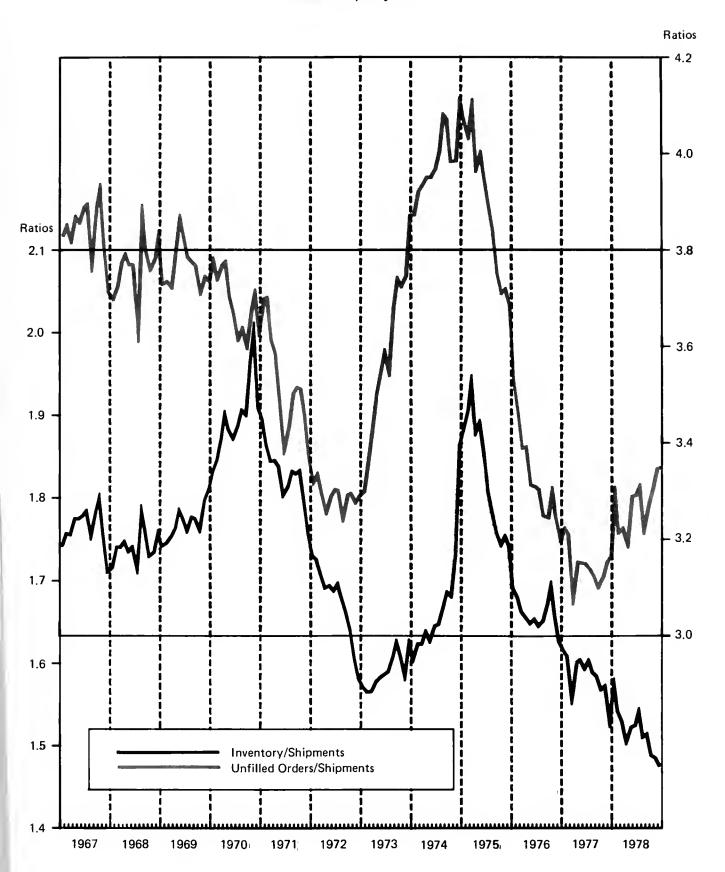

The percentage distribution estimates in table 9 were developed by 1) allocating the responding companies' December total inventory figures to the various valuation methods according to their supplemental survey responses, 2) aggregating these values to the 79 industry categories, and 3) calculating the percentage distribution of the computed aggregates. The value estimates were derived by applying these distribution percentages to the total industry estimates as published for December in the M3 survey.

These estimates may differ from the distribution of valuation methods used for public financial reporting or income tax purposes, since monthly valuations are generally based on internal accounting records. For example, a company may use LIFO for external reporting purposes and FIFO for internal accounting purposes and for reporting in this survey. In such instances, respondents were specifically instructed to report the valuation method used for the figure reported to the Bureau of the Census in the monthly M3 survey. These percentages are also believed to differ from the distribution of accounting methods used for inventories as reported for individual establishments in the Annual Survey of Manufactures (ASM), which provides the benchmark on which these inventory aggregates are based.

(Z) Less

<sup>(</sup>D) Theee figures are withheld to avoid disclosing figures for individual companies.

<sup>&</sup>lt;sup>1</sup>IMPORTANT NOTE: This table provides information on the distribution of the various inventory valuation methods used by responding companies for their end-of-year inventories reported in this survey. These estimates may differ from the distribution of valuation methods used for public financial reporting or income tax purposes. For a complete description of the survey, please read the accompanying text.

<sup>2</sup>These percentages entirely reflect usage of market valuation methods rather than other cost methods.

<sup>2--</sup>Consumer staples

<sup>3--</sup>Equipment and defense products, except automotive

<sup>4--</sup>Automotive equipment

<sup>5--</sup>Construction materials, supplies, and intermediate products 6--Other materials and supplies and intermediate products

### APPENDIX C. Monthly Calendar Adjustment Factors for 5, 1/2, 1/2 Trading-Day Adjustment and Other Selected Trading-Day Adjustments, Monthly: 1967 to 1979

(In general, the set of trading-day factors that yields the smallest residual irregular component (1) after seasonal adjustment are considered preferable. Statistical tests as part of the 1962 benchmarking operation showed that for most industry shipments aeries, the use of the 5, 1/2, 1/2 set of daily weights yields smaller irregular component factors than other alternatives. For a few series where the 5, 1/2, 1/2 adjustment was not appropriate, weights were selected using evidence contained in the specific data series. These series are listed separately below. In addition to trading-day weights, factors are adjusted to represent 1/12 of a year)

(NA) Not available. Separate seasonal factors for the industries tabulated in defense and nondefense components (ordnance, communication equipment, aircraft, sircraft parts, and shipbuilding) and motor vehicles and parts are not shown in this table. These industries are independently adjusted, but published in aggregate only.

# APPENDIX E. Average Percentage Changes and Related Measures for Series Components

Definition of Summary Measures — The following are brief definitions of the measures shown in this appendix. More complete explanations appear in Electronic Computers and Business Indicators, by Julius Shiskin, issued as Occasional Paper 57 by the National Bureau of Economic Research, 1957 (reprinted from the Journal of Business, October 1957).

"O" is the average month-to-month percentage change, without regard to sign, in the original series. "CI" is the same for the seasonally adjusted series. "I" is the same for the irregular component, which is obtained by dividing the cyclical component into the seasonally adjusted series. "C" is the same for the cyclical component which is a smooth, flexible moving average of the seasonally adjusted series.

"LHC" denotes the length of the Henderson Trend-cycle. If the irregular movements are small relative to the cyclical movements, then a short moving average will be selected (9 or 13 term). If the irregular movements are large relative to the cyclical movements, then a longer moving average will be selected, (23 term).

"I/C" is the average relative month-to-month change, without regard to sign, of the irregular component divided by the average relative month-to-month change, without regard to sign, of the cyclical component. It serves as an indication of the series' relative irregularity.

"MCD" represents months for cyclical dominance. The average without regard to sign percentage changes in the rregular component and cyclical component are computed for 1 month spans (January to February, February to March, etc.,) 2 month spans (January to March, February to April, etc.,) up to 5 month spans. MCD is the shortest span for which the average change (without regard to sign) in the cyclical com-

ponent is larger than the average change (without regard to sign) in the irregular component. Since changes are not computed for spans greater than 5 months, all series with an MCD greater than 5 are shown as 6. MCD is small for smooth series and large for erratic series.

"Average duration of run" is a measure of smoothness, and is equal to the average number of consecutive monthly changes in the same direction in any series of observations. When there is no change between 2 months, it is assumed that "no change" is a change in the same direction as the preceding change. The average duration of run is shown for the seasonally adjusted series CI, irregular component I, cyclical component C, and the MCD moving average. The MCD moving average is a moving average with the number of terms equal to MCD of the seasonally adjusted series.

"F-test"- The standard methodology for testing whether a series demonstrates stable seasonal fluctuation is the "F-test." In essence this test compares "between months" variance of the seasonal-irregular ratios (the original series divided by the trend-cycle fluctuation) against all other variance (residual variance) of the seasonal-irregular ratios. F is equal to the "between months" variance divided by the "residual" variance. If the computer F is greater than 2.41 (the 1 percent value for a 10-year series from a tabbed F-distribution), stable seasonality is present. This test demonstrates some shortcomings in identifying the presence of seasonality in only one month, or in identifying seasonality in a series that undergoes moving or changing seasonal patterns. These summary measures include a statement as to whether or not the "F-test" has been passed. In either event, the derived seasonal factors have been used to adjust the component series.

PART II-NEW ORDERS

New orders are not independently seasonally adjusted. The aggregate figures on both a seasonally adjusted and unadjusted basis are derived from the shipments for the current month and the change in unfilled orders from previous month.

ACKNOWLEDGMENTS—This report was prepared under the direction of Roger Bugenhagen, Chief of the Industry Division. Joanne Katz, Assistant Division Chief for Economic Indicator Programs, provided overall guidance for this report.

Within the Industry Division, the preparation of this report was performed under the supervision of Ruth Runyan, Chief, Shipments, Inventories, and Orders Branch, assisted by Kathleen Swindell and Stephen Andrews. Other contributing industry analysts include Jeffery Brister, Ronald Danna, Henry Haurand, Catherine Knudsen, Marilyn Monahan, Mattie Norwood, David Peterson, Anne Redeen, and Ruth Renwick. The assistance of Gladys Archer, David Cooper, Grace Daly, Deborah Dove, Norman Dyson, Donna Heiston, Ann Johnson, and Elizabeth Witcher is also appreciated.

Address inquiries concerning this report to the U.S. Department of Commerce, Bureau of the Census, Industry Division, Washington, D.C. 20233, or call Ruth Runyan or Kathleen Swindell, (301) 763-2502.

# Introduction

#### I. SUMMARY

The monthly seasonally adjusted data in the Current Industrial reports Series, M3, Manufacturers' Shipments, Inventories, and Orders, for 1958 to 1979 have been revised to reflect the updating of the seasonal adjustment factors resulting from the addition of the 1979 survey data. The monthly M3 report for April will also include data for January through March 1980 and will be consistent with the revised data for 1977 to 1979 shown in this publication.

Revisions to previously published seasonally adjusted data, resulting from the addition of 1979 survey data to the calculation of seasonal adjustment factors, are generally small. The total change for all manufacturing industries for 1979 was an average of 0.50 percent per month for new orders, 0.24 percent per month for shipments, 0.39 percent per month for unfilled orders, and 0.11 percent per month for inventories.

Although the data included in this report are limited to 1977 to 1979, information for 1958 to 1979 was included in the calculations of the seasonal factors. No significant revisions to the seasonally adjusted estimates for those years resulted.

The methodology followed in updating the seasonal adjustment factors is the same as that followed in the three previous annual publications. A complete discussion of this methodology can be found in Section II of this text.

The next benchmark report in this series is scheduled for release in the fall of 1980. This report will include (1) revisions to the shipments and inventories series to reflect benchmarking to the totals from the 1977 Census of Manufactures, (2) recalculation of the new order estimates, and (3) recomputation of the factors used to seasonally adjust the individual series. This report will be similar in format to the M3-1.8 report issued in August 1979.

## II. SEASONAL ADJUSTMENT METHODOLOGY

## A. The X-11 Variant Approach

The monthly data on shipments, inventories, and unfilled orders are adjusted for seasonality at the most detailed level tabulated in the survey using the X-11 variant of the Census Bureau's seasonal adjustment program.<sup>1</sup> Seasonally adjusted

industry aggregates are derived by adding seasonally adjusted components rather than by direct seasonal adjustment of the aggregates. Seasonally adjusted new orders data are similarly derived from the seasonally adjusted shipments and unfilled orders data.

## B. Trading-Day Adjustment Factors

The M3 survey does not use the trading-day adjustment option in the X-11 program, but rather adjusts the shipments data for monthly trading-day variations in the individual reports prior to tabulation. At the same time, the reports are adjusted for variations in the length of the report periods of companies. In effect, all reports are adjusted to reflect manufacturing shipments for one-twelfth of a year, or a standard month of approximately 26 trading days. (The number of trading days used in the tobacco, pulp and paperboard, and newspaper and periodicals industries varies slightly.) These composite adjustment factors are found in appendix A. Trading-day adjustments are reflected in both the seasonally adjusted and unadjusted published data.

## C. Special Adjustment for Specific Series

The routine X-11 procedure for the treatment of extreme values was used to adjust shipments data for strikes and other irregularities, except in the steel and the automotive industries.

- 1. Steel Industries. In the steel industry, a strike, or the anticipation of a strike, has occurred every 3 years, creating a general pattern of heavy ordering before the strike or settlement and a weak ordering rate afterwards. To eliminate the effects of these irregular movements from the calculations of the seasonal adjustment factors, data for the years in which a strike either occurred or had been anticipated<sup>2</sup> were excluded from the original data series. A pseudo series was then constructed using a beginning link point of December 1958 and the monthly ratios of change of the following years' data. After seasonally adjusting this pseudo series, the excluded years were reintroduced, with the seasonal factors for these years estimated to be the average of the preceding and following years' factors.
- 2. Automobile Industries. Each year the automotive assembly plants suspend operations to retool assembly lines for the next model year. This results in enormous fluctuations in the July,

<sup>&</sup>lt;sup>1</sup> Documentation of this program can be found in Electronic Computers and Business Indicators, National Bureau of Economic Research Occasional Paper 57 (New York, 1957); Tests and Revisions of Bureau of the Census Methods of Seasonal Adjustments, Bureau of the Census Technical Paper No. 5 (Washington, 1961); The X-11 Variant of the Census Method II Seasonal Adjustment Program, Bureau of the Census Technical Paper No. 15 (Washington, 1967).

<sup>&</sup>lt;sup>2</sup> The years 1959, 1962, 1965, 1968, and 1971 were excluded from the seasonal factor calculations. Data for 1974 and 1977 were retained, since early settlement of the strike in those years resulted in only minor irregular fluctuations in the data.

INTRODUCTION

August, and September data, which do not always occur in the same month or with the same magnitude every year. Since seasonal adjustment cannot be done during these months in the usual manner, a special procedure was used. As the model changeover period usually takes place entirely within this 3month period, the problem of the timing of the changeover was removed by modifying the input data to the seasonal adjustment program as follows. Current year shipments estimates for July, August, and September were developed based on production estimates published in advance by the industry. These estimates were then averaged, and the altered automotive series, i.e., with July, August, and September equal to each other, were seasonally adjusted. The seasonally adjusted estimates for July, August, and September were then averaged and included, at these August and September no change levels, in the published seasonally adjusted aggregates. An exception to this procedure was carried to the third quarter 1976 data. where a special adjustment for the August through September strike was made. (For the published seasonally unadjusted automotive data series, the original or reported data are included in the aggregates.)

3. Defense-Oriented Industries. Beginning in 1976, the fiscal year for the Federal Government was changed from a July 1 through June 30 basis to an October 1 through September 30 basis. The change probably affected the timing of purchases and the awarding of contracts. Although the impact of this change is not known, the use of previously established seasonal patterns would have substantially distorted the current data on new and unfilled orders, since these seasonal factors reflect historical Government purchasing patterns. To compensate for this shift in seasonality, a set of composite seasonal factors for unfilled orders was developed for the defense components of the communication equipment, aircraft, aircraft parts, shipbuilding, and ordnance industries for the period May 1976 through September 1977. The composites are based on an averaging of each month's seasonal factor (as normally calculated in the X-11 program) with the factor for the third month following, i.e., one quarter later. For example, if the adjustment factor for defense aircraft for November 1975 was 102.7 and for February 1976, 99.8, the factor used for seasonally adjusting February 1977 data would be 101.2. This method of calculating the seasonal factors will be used until a sufficient amount of data are available to assess the impact of the change in the fiscal year on the seasonal pattern of the defense industries.

## III. DESCRIPTION OF SURVEY

The Manufacturers' Shipments, Inventories, and Orders survey provides broad-based monthly statistical data on economic conditions in the domestic manufacturing sector. It is designed to measure current industrial activity and to provide an indication of future trends. The data are used extensively by the executive branch of the Government in developing economic, fiscal, and monetary policy; by the Bureau of Economic Analysis (BEA) as components of the gross national product estimates; and by trade associations, corporate eco-

nomists and other members of the business community as an analytical tool in their assessment of the current and future economic condition of the country.

The M3 shipments and inventory data are comparable to the annual totals published each year in the Annual Survey of Manufactures (ASM). The ASM is a probability sample of approximately 70,000 manufacturing establishments drawn from the most recent 5-year census universe of about 312,000 establishments. In the ASM, each manufacturing establishment provides data on employment, payrolls, shipments, cost of materials, capital expenditures, and inventories as well as other selected items. Until 1976, the ASM did not compile information on unfilled orders or new orders. Since the ASM is establishment based, it provides data for each of the 425 manufacturing industries in the Standard Industrial Classification (SIC) system and area data for industry groups.

The estimates presented in the M3 report are based on a sample panel of approximately 5,000 reporting units, consisting of virtually all manufacturing companies with 1,000 or more employees and additional medium-sized companies that strengthen the sample coverage in individual industry cells. The reporting unit for many medium- or single-line companies comprises all operations of the company. Many of the larger diversified companies file separate divisional reports for their operations in different industries, although this divisional reporting is not followed by all large companies.

Each reporting unit in the monthly panel is classified into one of 79 industry classifications for tabulation. Many of the reporting units included mixed industry activity even within the broad industry categories of the monthly survey. However, the survey estimating procedure assumes that the month-to-month changes of the reporting units classified in each industry category effectively represent the month-to-month movements of the establishments in the SIC industries which make up the category. This ratio estimating procedure is used for all items compiled in the survey except for new orders, which is discussed separately below.

The M3 series is periodically benchmarked to the ASM for shipments and inventories. The most recent benchmark was for 1974 through 1976 and issued in the report M3-1.7 released in March 1978. In the absence of benchmark data for unfilled orders, levels were set in August 1962 based upon the ratio of unfilled orders to sales for companies reporting in the M3. These levels were reset as of December 1973 in the M3-1.6 benchmark publication released in December 1976.

The M3 data are subject to some limitations primarily resulting from the relatively small sample used to develop the estimates and the use of divisional and company reports to extrapolate establishment based data. Precise measurement of these limitations based on estimates of the sampling errors is not available. In addition to the general limitations of M3 survey data, the estimated levels of unfilled orders are subject to further limitations due to the assumptions made in developing these levels, the definition of unfilled orders, and response difficulties. These limitations are discussed in greater detail on pages i-iv in the introductory chapter of the latest benchmark publication, M3-1.6, issued in December 1976. Generally, the limitations to the unfilled orders data primarily apply to

the absolute level of unfilled orders and, to a much lesser extent, to the month-to-month change in unfilled orders. Since this month-to-month change in unfilled orders is used to develop the monthly estimates of new orders, the estimates of new orders are subject to fewer limitations than the unfilled orders estimates.

## IV. EXPLANATION OF TERMS

## A. Value of Shipments

Shipments in the monthly survey are equivalent to value of shipments as reported in the ASM, which are received or receivable net selling values, f.o.b. plant, after discounts and allowances and excluding freight charges and excise taxes. Included in shipments are the value of all products sold, transferred to other plants of the same company, or shipped on consignment.

Shipments also include receipts of establishments in the industry for contract work performed for others, resales, receipts for miscellaneous activities such as the sale of scrap and refuse, value of installation and repair work performed by employees of the plant, and value of research and development performed at the plant. In the shipbuilding industry the value of work done in a given year varies considerably from the value of shipments because of the long lead time between the input of the material and labor and the delivery of the completed ship. In the annual survey, therefore, the value of work done during the year is requested rather than the value of shipments. Value of work done is also reported by aircraft and missile producers working on cost-plus contracts.

The value of shipments figures developed from the ASM contain duplication at the all manufacturing and industry group levels since the products of some industries are used as material by other industries within the industry group. With the exception of motor vehicles, it is not significant at the four-digit SIC group level. Since the M3-1 industry categories typically are groupings of industries, this duplication is significant for all the manufacturing, durable goods and nondurable goods categories, and the various market groups. The significance of the duplication within the specific M3-1 industry groups varies depending on the four-digit industry composition of these groups. It is most pronounced in a few highly integrated industry areas such as primary metals and motor vehicles and parts.

Since most monthly reports are for the entire company or major divisions rather than establishments, the companies are requested to report net sales, i.e., total company billings after discounts and allowances. Companies which file divisional reports are requested to treat transfers from one division of the company to another as if they were net sales to outside customers. Although this definition of shipments in the monthly reports differs from that used in the annual establishment reports, it is assumed that the month-to-month changes in

company sales in the industry are representative of the monthto-month shipments of the establishments in the industry.

#### B. Inventories

End-of-month inventories in the monthly survey are identical in definition to the end-of-year inventories in the ASM. In the ASM, respondents are asked to report inventories of individual establishments at book value by whatever method derived. Since different methods of inventory valuation are used (LIFO, FIFO, etc.), the definition of the aggregate inventories for establishments in an industry is not precise. The figures on the change in inventories from one period to the next are of greater significance than the actual aggregates.

Inventories are reported by stage of fabrication: (a) finished goods; (b) work in process; and (c) materials, supplies, fuel, and other inventories. In using inventories by stage of fabrication at the all manufacturing and two-digit industry levels as well as for the durable and nondurable goods sectors, it should be noted that a finished product of one industry may be a raw material for another industry at the next stage of fabrication. Insofar as the durable and nondurable goods sectors and also the two-digit industry groups contain industries with successive stages of processing, the same type of commodity may be included under different inventory categories in the aggregate statistics.

## C. New Orders and Unfilled Orders

The unfilled orders shown in this publication represent the net sales value of goods on order which have not been shipped. They are net of cancellations and include all adjustments resulting from contract change documents. Only those orders supported by binding legal documents such as signed contracts or letter contracts are included. Some large defense contracts are authorized and funded in several stages. Only the funded portion of such contracts are included in these figures.

New orders are not calculated according to the standard ratio estimate procedure, even though they are collected as a separate item. The reason for this is that not all companies report new orders, and some that do limit their reporting to specific products for which long lead times are required in the production cycle. These companies, in effect, exclude new orders received for products that are shipped from inventory. To take advantage of the higher response rate for shipments data and to include orders filled from inventory, new orders are computed by adding the change in the backlog of unfilled orders to the current month's shipments. Thus, the estimate of new orders includes orders that are received and filled in the same month as well as orders that have not yet been billed. The estimate also includes the effects of cancellations and modifications of previously existing contracts.

Seasonally adjusted new orders are similarly derived from the monthly change in the seasonally adjusted backlog of unfilled orders and seasonally adjusted shipments. Many nondurable goods industries and some durable goods industries have no backlog or unfilled orders. Shipments are used as the estimate of new orders in these industries.

## APPENDIX A. Monthly Calendar Adjustment Factors for 5, 1/2, 1/2 Trading-Day Adjustment and Other Selected Trading-Day Adjustments, Monthly: 1977 to 1980

(in general, the set of trading-day factors that yields the smallest residual irregular component (I) after seasonal adjustment is considered preferable. Statistical tests as part of the 1952 benchmarking operation showed that for most industry adjustments series, the use of the 5, 1/2, 1/2 set of daily weights yields smaller irregular component factors than other alternatives. For a few series where the 5, 1/2, 1/2 adjustment was not appropriate, weights were selected using evidence contained in the specific data series. These series are listed separately below. In addition to trading-day weights, factors are adjusted to represent 1/12 of a year)
